

(a) Decision-level calibration

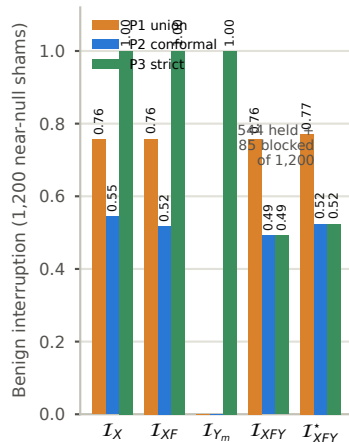

Bars: pooled rate; whiskers: range of the eight per-environment cluster means. Conformal exact level $10/201 = 0.0498$.

(b) Unsafe allow versus clean false action

Clean false-action rate (trusted: 1,200 exact-zero rows)

(c) Cost on benign in-place variation

Same 1,200 rows for every regime. The trusted regime's zero unsafe allows and zero clean false actions cost 52% benign interruption.
